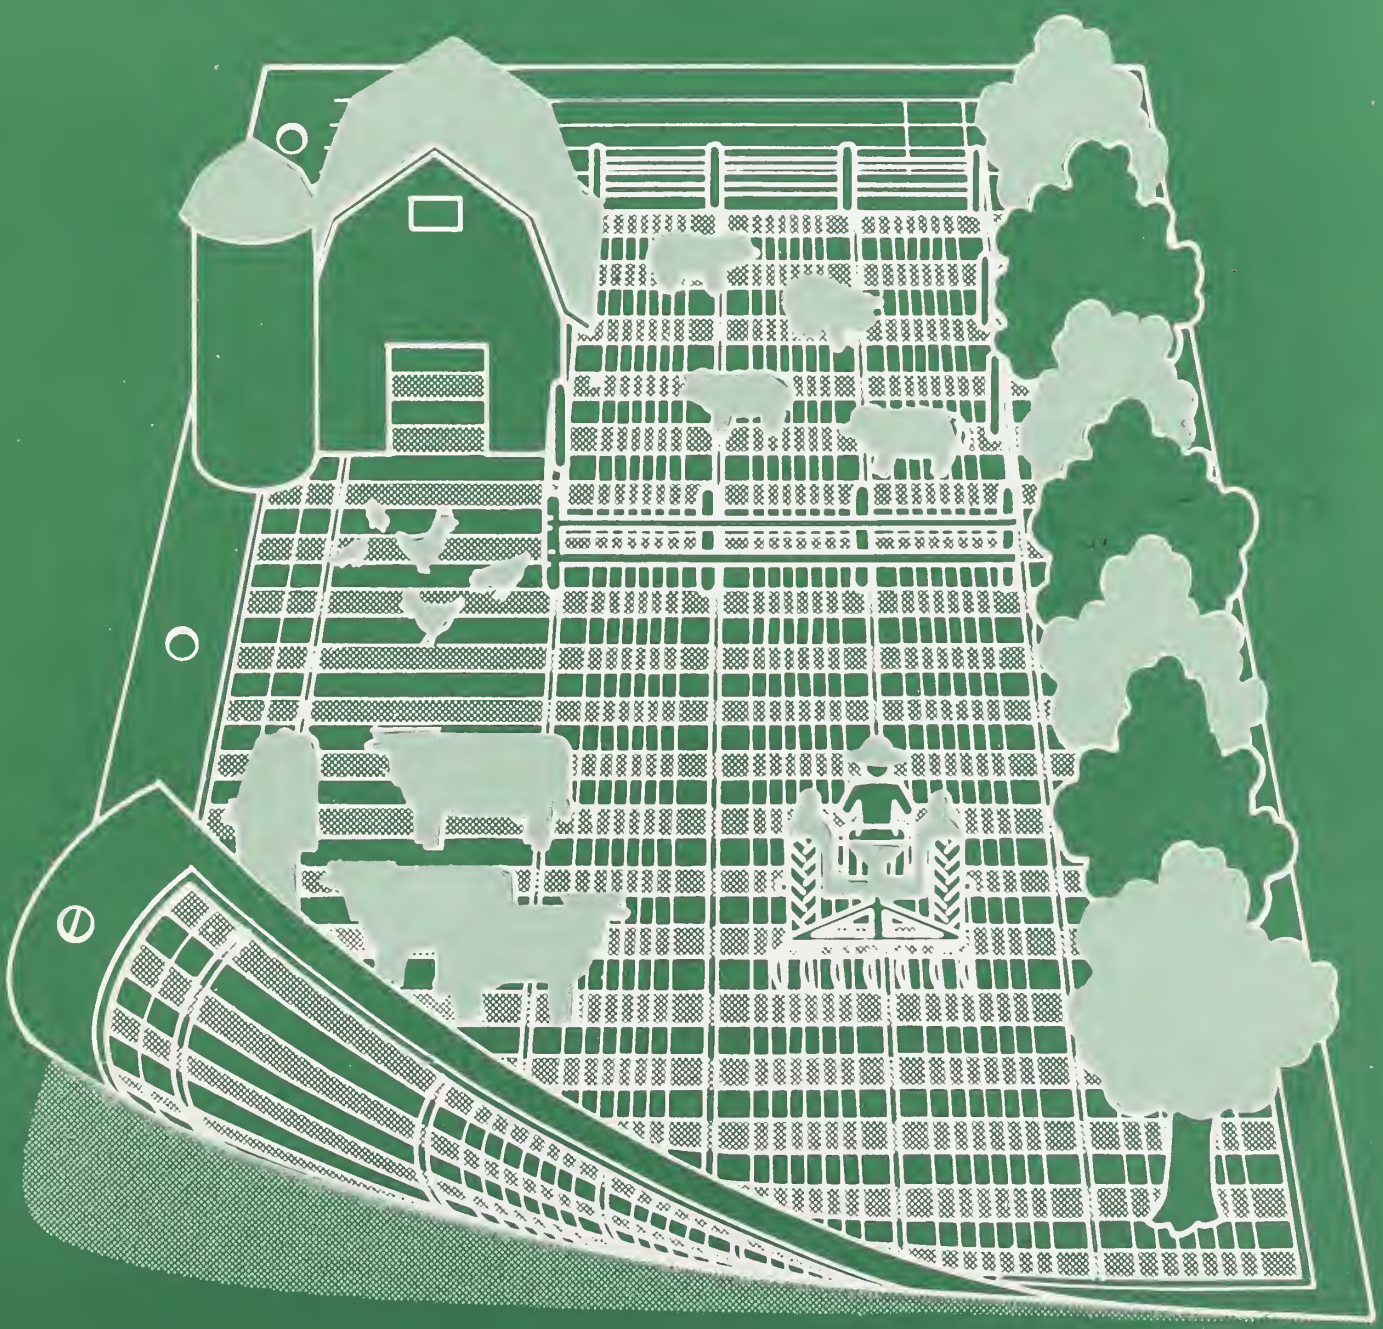
Economic Indicators of the Farm Sector

State Financial Summary, 1989



It's Easy To Subscribe!

Just dial 1-800-999-6779. Toll free.

Ask for ***Economic Indicators of the Farm Sector*** series.

The series is available by subscription. Five separate reports are published each year:

National Financial Summary
State Financial Summary
Costs of Production—Livestock and Dairy
Costs of Production—Major Field Crops
Production and Efficiency Statistics

Subscription rates are $14 per year. Multiyear subscriptions are available at $27 (2 years) and $39 (3 years). Single copies are $8.00 each. For non-U.S. addresses, add 25 percent (includes Canada). Charge your purchase to your VISA or MasterCard, or we can bill you. Or send a check or purchase order (made payable to ERS-NASS) to:

ERS-NASS
P.O. Box 1608
Rockville, MD 20850

CAN YOU USE AN ELECTRONIC DATABASE?

An electronic database containing the data in this report is available. This database is in the form of Lotus 1-2-3 worksheet files on DOS-compatible 5.25" or 3.5" diskettes.

To order, just dial 1-800-999-6779. Toll free.

Ask for the State Financial Summary database (order #88010A, 5.25" disks, $95 or order #88010B, 3.5" disks, $35). For non-U.S. addresses, add 25 percent (includes Canada). Charge your purchase to your VISA or MasterCard, or we can bill you. Or send a check or purchase order (made payable to ERS-NASS) to:

ERS-NASS

Economic Indicators of the Farm Sector: State Financial Summary, 1989.
Agriculture and Rural Economy Division, Economic Research Service, U.S. Department of Agriculture. ECIFS 9-3.

Abstract

California led in net farm income for 1989 with $6.0 billion. Texas was second with $3.0 billion, followed by Florida ($2.6 billion), Iowa ($2.4 billion), and Illinois ($2.2 billion). Net farm income reflects cash income minus cash expenses plus adjustments for noncash and operator dwelling income and expenses. Cattle and calves and dairy products were the top commodities in cash receipts. Texas led cattle and calf receipts with $5.1 billion, and Wisconsin topped dairy sales with $3.2 billion. Corn and soybeans were the third- and fourth-ranked commodities, and Illinois led in sales for both, with receipts of $2.0 billion and $1.8 billion, respectively. Hogs was the fifth-ranked commodity, and Iowa was the leader with receipts of $2.4 billion.

Keywords: Net farm income, returns to operators, farm assets, and farm debt.

Washington, DC 20005-4788 February 1991

Preface

This report is one of five segments in the *Economic Indicators of the Farm Sector* series. Other reports are *National Financial Summary, Production and Efficiency Statistics, Costs of Production--Major Field Crops,* and *Costs of Production--Livestock and Dairy.*

State Financial Summary, 1989, corresponds to the national farm income and balance sheet accounts published in *National Financial Summary, 1989,* disaggregated to State levels. One major feature of these reports is the separation of the operator's farm dwelling and household from farm production transactions, assets, and debt. All of the income estimates in these reports are based on the calendar year.

The data are based on information mainly from the U.S. Department of Agriculture's National Agricultural Statistics Service (NASS) and the *Census of Agriculture.* Additional information is obtained from other Government agencies and, in some cases, from private sources. Revisions were made for 1982-88. State-level farm income estimates for 1989 are published for the first time.

This publication was prepared by the staff of the Farm Income Estimation Section and the Farm Financial Analysis Section, Farm Sector Financial Analysis Branch, Agriculture and Rural Economy Division, Economic Research Service.

Principal contributors and information sources:

Branch chief: Jim Johnson . . . . . (202) 219-0800

Farm income: Roger Strickland 219-0804
Cash receipts--Bob Williams, Billie Whittington, Cheryl Johnson 219-0804
Government payments, CCC loans--Pat Vines 219-0804
Production expenses--Christopher McGath 219-0804
Farm-related and off-farm income--Linda Farmer 219-0804

Balance sheet: Duane Hacklander 219-0798
Assets--Ken Erickson, Charles Barnard 219-0799
Debt--Jim Ryan 219-0798
Returns to equity--Ken Erickson 219-0799

Highlights

In 1989, summer crops returned to normal yields following the 1988 drought, which was especially severe in the Corn Belt. Production of corn and soybeans was up 53 percent and 24 percent, respectively. While corn prices declined throughout 1989, they began the year at high levels because of the 1988 drought and remained high when compared with the period before the drought. Crop receipts increased, and feed prices remained relatively high. Thus, livestock producers paid considerably more for feed. Net farm income rose 11.7 percent to $46.7 billion. However, net cash income fell 6 percent to $54.6 billion because farmers used a portion of their production to rebuild their commodity stocks that were drawn down during the 1988 drought.

Here are the 1989 rankings for the major farm financial indicator accounts:

California led all States in total cash receipts from farm marketings with $17.5 billion, followed by Texas, $10.8 billion; Iowa, $9.1 billion; Nebraska, $8.5 billion; and Illinois, $6.7 billion. Texas, Nebraska, Iowa, California, and Wisconsin led in livestock receipts while California, Florida, Illinois, Iowa, and Texas led in crop receipts.

Top earners of cash receipts for specific commodities were Texas for cattle and calves, Wisconsin for dairy products, Illinois for corn and soybeans, Iowa for hogs, Arkansas for broilers and rice, California for greenhouse and nursery products, eggs, hay, tomatoes, grapes, and lettuce, Kansas for wheat and sorghum, and North Carolina for tobacco and turkeys.

The ranking and composition of the top five States for net farm income changed from 1988 as the return to normal weather and corn yields caused Iowa and Illinois to move up in the rankings, dropping Nebraska to sixth place. Net farm income (1988 shown in parentheses) changed little. California led with $6.0 billion ($6.1 billion); Texas, $3.0 billion ($3.2 billion); Florida, $2.6 billion ($2.6 billion); Iowa, $2.4 billion ($2.0 billion); and Illinois, $2.2 billion ($1.2 billion).

California also led all States with the highest net cash income from farming ($6.5 billion in 1989). Texas earned $4.3 billion, followed by Florida, $2.9 billion; Nebraska, $2.5 billion; and Iowa, $2.4 billion.

Both net farm income and net cash income reflect cash income less cash expenses. Net farm income also includes noncash income and expense items on an accrual basis, plus expenses and income associated with onfarm residences. Net cash income simply reflects the difference in cash income and cash expenses associated with the farm business.

Balance sheet accounts showed that the leading States in assets (excluding operator households), as of December 31, 1989, were: Texas, at $77.4 billion; California, $56.0 billion; Iowa, $46.6 billion; Illinois, $46.2 billion; and Nebraska, $33.8 billion. California farmers owed the most total debt, $12.1 billion, followed by Texas, $9.7 billion; Iowa, $9.3 billion; Illinois, $7.1 billion; and Minnesota, $6.5 billion. Texas registered the largest equity, $67.7 billion, followed by California, $43.8 billion; Illinois, $39.1 billion; Iowa, $37.3 billion; and Nebraska, $27.7 billion.

States with the highest debt-to-asset ratios, excluding operator households, were Wisconsin with 23.6 percent; New York, 22.7 percent; Mississippi, 22.3 percent; California, 21.7 percent; and Minnesota, 20.7 percent.

Economic Indicators of the Farm Sector
State Financial Summary, 1989

1989 Agriculture Wrap-Up

Net farm income rose 12 percent in 1989 and net cash income fell 6 percent as farmers increased production and replenished their inventories of crops. Both crop and livestock receipts rose 6 percent. The value of inventory adjustment went from a $4.1-billion drop in 1988 to a $4.4-billion replenishment in 1989. Direct Government payments fell 25 percent and production expenses climbed 8 percent. Production was up for two reasons. First, crop yields were higher than those of the drought-reduced levels of 1988. Second, farmers put more resources into production in an effort to reap the benefits of higher prices. Corn and soybean production was up 53 percent and 24 percent, respectively. These were the two major crops most affected by the 1988 drought that struck hardest in the Corn Belt. Farmers used a substantial portion of the production in 1989 to replenish crop inventories sold in 1988, when crop prices rose after the effects of the drought were realized. The placement of production in inventories in 1989 was the major contributor to the divergence in net farm income and net cash income.

The farm sector balance sheet excluding operator households continued to improve, as farm equity increased for the third year in a row. The value of farm assets rose for the third consecutive year, increasing $30.4 billion to $793.9 billion, and debt declined $2.0 billion in a continuation of a 6-year trend. The 4-percent rise in farm asset values and the decline in farm debt boosted the equity in farm assets by 5 percent to $658.3 billion. The total real rate of return on equity, at 5.0 percent, was positive for the third year in a row.

Background

Most of the farm income and balance sheet statistics in this publication are for 1985-89 and are derived from five measures of farm income and two measures of the farm balance sheet. Dependence on any one measure would give a misleading picture of the financial farming conditions. Because there are differing concepts and definitions of income and equity, readers are urged to carefully choose the most appropriate measures for their purpose. For help in choosing the appropriate measures refer to illustration 1, and the following text.

USDA defines a farm as any establishment that sells or normally would sell $1,000 of agricultural products in a calendar year. The principal operator of a farm is defined as the individual making the largest number of day-to-day management decisions of planting, purchasing, harvesting, and marketing. When partners share equally in the decisionmaking, the oldest partner is considered the principal operator. The operator category includes owner-operators, partners, tenants, paid and unpaid managers associated with corporate or institutional farms, and operators who receive a fee for raising crops or livestock under contracts.

The net income in four of the five income accounts, net farm income, net cash income, net business income, and the farm production transactions account do not represent income to the operator. Rather, the net income in these accounts represents the income earned by the farm sector. This farm income is divided among the owner-operators, partners, tenant-operators, shareholders in farming corporations, and contractors. Hired managers, although operators of farms, do not share in the net income proceeds because their salaries are treated as an expense in the hired labor account. For more information on farm income and balance sheet accounts readers may wish to consult the handbooks on these accounts: *Major Statistical Series of the U.S. Department of Agriculture--Farm Income,* AH-671, Vol. 3, U.S. Dept. Agr., Econ. Res. Serv., Nov. 1988, and *Major Statistical Series of the U.S. Department of Agriculture--The Balance Sheet,* AH-671, Vol. 11, U.S. Dept. Agr., Econ. Res. Serv., May 1989.

State Income Accounts

State financial data appear in two major sections: income accounts and balance sheets. Net farm income is the only income account that includes income from onfarm dwellings. The other four income accounts—net cash income, net business income, net cash-flow, and farm production transactions—exclude onfarm dwelling income.

Returns to operators, the residual in the farm production transactions account, is equal to net farm income minus the net income from onfarm operator dwellings. See illustration 2.

Illustration 2--Difference between net farm income and returns to operators, 1989

Item	Net farm income (A)	Returns to operators (B)	Operator dwelling income (A minus B)
	Million dollars

NA = not applicable.

Rankings by Commodity and State

California led the Nation with $17.5 billion in cash receipts from all commodities in 1989. Because of the diversity of its agriculture, California's five top commodities in sales—dairy products, greenhouse/nursery, grapes, cattle, and cotton—accounted for just 47 percent of the State's total cash receipts. California led in crop sales and was the top producer of greenhouse and nursery products, eggs, hay, tomatoes, grapes, and lettuce. The State ranked fourth in total livestock earnings. Texas ranked second in cash receipts, with $10.8 billion in sales, first in all livestock, and fifth in all crops. Texas was the leading producer of cattle and calves and cotton and was second in sales of grain sorghum. Iowa ranked third in cash receipts, with $9.1 billion, and had the third highest sales of livestock and the fourth highest crop sales. Nebraska ranked fourth, with $8.5 billion in sales of all commodities, while Illinois ranked fifth, with $6.7 billion in sales.

In 1988, California, Texas, Iowa, Nebraska, and Kansas ranked as the top States in cash receipts for all commodities. Texas led in livestock receipts, and California earned the highest crop receipts.

Net Farm Income

Net farm income reflects the net value of agriculture production during a calendar year. In 1989 the five leading States in net farm income were California ($6.0 billion), Texas ($3.0 billion), Florida ($2.6 billion), Iowa ($2.4 billion), and Illinois ($2.2 billion). Production expenses, including those of the operator dwelling, rose to $142.6 billion from 1988's $132.0 billion. The leading States in production expenses were California, $12.9 billion; Texas, $10.0 billion; Iowa, $9.4 billion; Nebraska, $8.0 billion; and Illinois, $7.2 billion. The composition and the ranking of the group was unchanged from 1988.

Net farm income is a measure of the net value of production in a given year, reflecting cash and noncash components in both income and expenses. Noncash income includes home consumption of commodities produced onfarm, imputed rental value of all farm dwellings, and the value of the change in inventories. The value of change in inventory eliminates the effects of production sold from prior years and accounts for current-year production that remains unsold and unused at the end of the year. Inventories of crops typically rise during years of heavy production because of depressed prices and decline when production is below normal as farmers take advantage of higher prices. Noncash expenses include capital consumption (depreciation and accidental damage) and perquisites to hired labor. Capital consumption measures the replacement cost of durable goods consumed in agricultural production

through normal wear and tear, obsolescence, and destruction. Because they represent replacement cost, ERS capital consumption figures indicate the amount that must be spent on capital items so the end-of-year stock is capable of providing the same services as the beginning-of-year stock.

The net farm income account differs from the other four accounts by the inclusion of income and expenses related to the farm operator's dwelling. ERS treats the imputed rental value of the operator's dwelling as income and includes expenses associated with the operator's dwelling: repair and maintenance, interest, taxes, capital consumption, and insurance.

Farm Production Transactions

Returns to operators rose by $4.4 billion in 1989 to $44.5 billion. California led the Nation in returns to operators, at $5.8 billion, followed by Texas, $2.8 billion; Florida, $2.5 billion; Iowa, $2.3 billion; and Illinois, $2.1 billion. The 1988 totals were: California, $6.0 billion; Texas $3.0 billion; Florida, $2.6 billion; Nebraska, $2.0 billion; and Iowa, $1.9 billion.

Returns to operators are computed as gross receipts less both nonfactor and factor payments. This measure of returns is equal to net farm income minus the net income generated by onfarm operator dwellings. The principal component of nonfactor payments is intermediate product expenses, which include farm-origin inputs such as purchases of feed, seed, livestock, and poultry, and nonfarm-origin inputs such as fertilizer, fuel, repairs, storage, and transportation. The other components of nonfactor payments are capital consumption and property taxes. Nonfactor payments rose to $103.8 billion from $94.8 billion.

Factor payments are the income returns to the factors of production: land, labor, and capital. These returns are interest, wages to hired labor, net rent to nonoperator landlords, and returns to operators. The returns-to-operators component is the net income earned by operators for their labor, management, and capital used in farming. Factor payments increased to $79.1 billion from $72.6 billion during 1989.

Net Cash Income

Net cash income from farming fell to $54.6 billion in 1989 from $58.1 billion a year earlier. Net cash income from farming was highest in California, at $6.5 billion, followed by Texas, $4.3 billion; Florida, $2.9 billion; Nebraska, $2.5 billion; and Iowa, $2.4 billion. In 1988, the top earners were California, Texas, Iowa, Florida, and Minnesota.

Net cash income reflects the difference in cash income and cash expenses associated with the farm business. Net cash income from farming is a measure of the funds generated by the farm business for capital purchases, loan repayments, income taxes, and family living expenses.

Net Business Income

Net business income in 1989 was $39.5 billion, down 9.3 percent from $43.5 billion in 1988. California led all States with $5.8 billion, followed by Texas, $3.3 billion; Florida, $2.6 billion; Nebraska, $1.8 billion; and Wisconsin, $1.6 billion. In 1988, the State rankings were California, Texas, Florida, Iowa, and Minnesota. Changes in net business income approximate changes in net cash income in periods when capital consumption is stable. In 1989, capital consumption increased only slightly and the two income measures experienced similar decreases.

Net business income measures earnings by farmers. It is net cash income minus capital consumption, which is the sum of depreciation and accidental damage to farm equipment and buildings. This measure corresponds closely to accounting methods used by most farmers to compute their taxable incomes. Under the Internal Revenue Service's cash accounting method, income is computed as gross cash income minus the sum of cash expenses, hired labor perquisites, depreciation, and net casualty losses. USDA's measure of the farm sector's net business income does not agree with taxable farm income reported to the IRS on Schedule F, because of several conceptual differences. One major difference is the treatment of depreciation. IRS allows farmers many choices regarding the parameters of the depreciation schedules, and farmers employ many variations for tax purposes. The ERS depreciation account represents economic depreciation and is measured at replacement cost rather than purchase price.

Off-Farm Income

Off-farm income for principal farm operators and their families remained unchanged in 1989. The States leading in off-farm income for principal farm operator families were Texas, $8.3 billion; California, $3.5 billion; Missouri, $3.0 billion; Oklahoma, $2.6 billion; and Kentucky, $2.5 billion. Off-farm income includes cash income from off-farm jobs, nonfarm businesses, retirement, interest and dividends, royalties, and all other sources of cash income.

Data Sources

Data for the five income accounts are based on many sources, which change over time based on improved methodologies and new data. Some general comments can be made regarding current data sources. Cash

receipt data, by commodity, State, and month, are based on production data from USDA's National Agricultural Statistics Service (NASS). Inventory adjustment is also based on NASS data. Data on direct Government payments and CCC loans made and repaid come from USDA's Agricultural Stabilization and Conservation Service. The *Census of Agriculture* and the Farm Costs and Returns Survey (FCRS) provide data to compute the other gross income items and production expenses. Data from private industry and Government agencies are also used to estimate production expenses. The *Census of Agriculture* is a reliable source of data but is available only every 5 years. Therefore, a benchmark-mover system is employed in accounts dependent on *Census of Agriculture* data. As census data become available, we develop new census benchmarks and move the census data according to the most appropriate annual data between census benchmarks. FCRS is usually the most appropriate annual data source.

State Balance Sheet Accounts

Farm sector balance sheets contain the current market value of assets, debts (liabilities), and net worth or wealth (assets minus liabilities). The farm sector may be viewed either as a business (excluding personal assets and liabilities of farm households) or as a firm/household (including both farming and personal activities of farm households), so ERS estimates two balance sheets. Both balance sheets include the landlords' and the farm operators' farm business assets and debt. The account that includes operator households contains part of the farm families' personal assets, such as the value of the operator dwelling if located on the farm, the value of farmers' household equipment and furnishings, the portion of automobiles and trucks used for nonfarm purposes, time deposits, savings bonds, and the related debt on these items.

Assets, Debt, and Equity

Total farm assets (excluding operator households) rose to $793.9 billion on December 31, 1989, up 4.0 percent from the previous year. Fluctuating real estate values strongly affected total farm (excluding operator households) assets because real estate assets were 72.8 percent of total farm asset values in 1989.

The States with the highest farm asset values (excluding operator households) were Texas, at $77.4 billion; California, $56.0 billion; Iowa, $46.6 billion; Illinois, $46.2 billion; and Nebraska, $33.8 billion.

Total U.S. farm debt (excluding operator households) was $135.6 billion, a 1.4-percent drop from a year before. Real estate debt fell 2.7 percent, and nonreal estate debt remained nearly the same. California was the leading State in total debt (excluding operator households), at $12.1 billion, the same as in 1988. Texas was second in total liabilities, at $9.7 billion, down from $10.1 billion. Iowa ranked third, at $9.3 billion, the same as in 1988; Illinois ranked fourth with $7.1 billion, down from $7.2 billion; and Minnesota ranked fifth with $6.5 billion, down from $6.6 billion.

Equity (excluding operator households) rose $32.4 billion from December 31, 1988, to December 31, 1989, to a level of $658.3 billion. Texas registered the largest equity, at $67.7 billion, followed by California, $43.8 billion; Illinois, $39.1 billion; Iowa, $37.3 billion; Nebraska, $27.7 billion; and Minnesota, $24.8 billion. Virginia realized the greatest increase in equity, 22.5 percent. Montana showed an 18.3-percent rise, and Idaho's farm equity rose 18.1 percent.

Debt-to-Asset Ratio

The debt-to-asset ratio provides insight into the collateral security of loans (a security pledged against the performance of a contract), the relative indebtedness of the farm business, and the risk borne by lenders. The farm sector debt-to-asset ratio (excluding operator households) had fallen to 17.1 percent from 18.0 percent by the end of 1989. Wisconsin had the highest 1989 debt-to-asset ratio of all States, at 23.6 percent, followed by New York, 22.7 percent; Mississippi, 22.3 percent; California, 21.7; and Minnesota, 20.7 percent.

Improvements and Changes to the Accounts

Farm program changes in the mid-1980's have encouraged farmers to place and redeem CCC quantities within the same month. Restructured CCC loan rates, Payment-in-Kind (PIK) program benefits, and transferable certificates provide incentives for farmers to reduce their CCC commodity stocks. Farmers redeem their CCC commodities if they can achieve a financial gain in doing so. Farmers initiate redemptions when the market price is above the CCC loan rate, or they are offered additional benefits to redeem under other Government programs. In the latter situation, some of the benefits are reflected in Government payments. In either case, a separate accounting of CCC placements and redemptions ensures better quality cash receipts and inventory adjustment figures in the farm income accounts. ERS has begun this separate accounting effective with the year 1986.

This accounting change for CCC loans has resulted in substantial revisions to cash receipts. Because the calculation procedures for cash receipts and inventory adjustment are linked, substantial revisions were also made in the value of inventory adjustment. The revisions in cash receipts were nearly offset by revisions in inventory adjustment. Therefore, the CCC accounting change has had little effect on gross farm income and net farm income. In gross cash income and net cash income from farming, the procedural change has a significant impact since these measures do not reflect inventory adjustments, a noncash item, and thus contain no offset to changes in cash receipts.

Changes in Income and Expenses for Farm Dwellings

After 2 years of reviewing the conceptual basis and computational procedures for the gross imputed rental value of farm dwellings and the related dwelling expenses, analysts replaced the traditional procedure that was based on a user-cost concept by a procedure based on market-observed rents for housing for 1984-89. In the new procedure, the gross rent is computed by multiplying the ratio of gross rent to market value of dwellings for urban dwellings by the market value of farm dwellings.

This procedural change for computing gross rental value was necessary because the user cost method, although conceptually correct, is difficult to empirically implement since the rate of return on equity must be specified. Before, analysts used the average farm mortgage interest rate on farm real estate as a proxy for the rate of return on equity. High inflation rates during the 1970's and high interest rates during the 1970's and early 1980's led to estimates derived from the user-cost procedure that was increasingly unjustifiable. By the late 1980's, the gross imputed rent for farm dwellings divided by the market value of farm dwellings reached more than 20 percent. In contrast, market-observed data on gross rents and values for urban housing yielded a gross rent-to-value ratio in the range of 7 percent. The misalignment of the gross imputed income from farm dwellings can be attributed to an excessively high rate of depreciation and the use of a nominal rate of return to equity without an offsetting adjustment for capital gains. The misalignment during the mid to late-1980's was lessened, however, by a substantial understatement of the value of farm operator dwellings in the balance sheet.

Analysts significantly changed computational procedures for farm dwelling expenses starting with 1984. Depreciation rates for dwellings were lowered, and the computational procedure for depreciation simplified. All other farm dwelling expenses (interest, property taxes, insurance, and repairs and maintenance) are now computed from the FCRS data beginning in 1984, when a new question on the value of onfarm dwellings was incorporated into the survey. Before 1984, ERS analysts estimated dwelling expenses by using ratios of dwelling value to either total farm real estate value or to building value and applying these ratios to total farm expenses. Data users wishing to do time series analysis by using the imputed rent series may wish to give consideration to the inconsistencies in the statistics before and after 1984. ERS analysts will review during 1991 the possibility for extending the new computational procedures on farm dwelling gross rent and expenses for years before 1984.

New Data Sources and Adjustments

The publication contains many revisions in the farm income and expenses components for 1983-88. Most of the revisions resulted from the incorporation of the *1987 Census of Agriculture* data and the adjustment for the undercount of farms in the annual FCRS. When census data are released, ERS analysts review all farm income items that use census data in their computational processes. Because the *Census of Agriculture* is conducted only once every 4 or 5 years, ERS analysts use census data as benchmarks and use data from other sources to move the benchmarks between census years. The last census benchmark is held constant until the arrival of new census data. When the 1987 census data became available, ERS analysts added a new benchmark for 1987 and interpolated between the 1982 and 1987 census benchmarks. Hence, accounts depending on census data were revised from 1983-88.

On the income side, ERS analysts indirectly incorporate census data into marketings of farm commodities under cash receipts. The National Agricultural Statistics Service (NASS) revises many of its production figures using the 1987 census figures. ERS analysts use the NASS revised figures in the computational process for

cash receipts. Revisions to cash receipts are usually minor because NASS price and production statistics are survey based. ERS analysts also incorporate the 1987 census data into the farm-related income accounts.

The incorporation of *1987 Census of Agriculture* data produced substantial revisions in the 1983-88 estimates for production expenses benchmarked to previous censuses: feed, seed, fertilizer and lime, pesticides, fuel and oil, electricity, and machine hire and customwork. The 1987 census also collected data on repair and maintenance expenses, property taxes, and cash rent to landlords (part of net rent to nonoperator landlords) for the first time. Benchmarking these expenses to the census caused revisions in their estimates for 1987-88.

The estimates for expenses previously benchmarked to the 1982 census had been calculated: 1982 census divided by 1982 FCRS times the current-year FCRS. When the results of the *1987 Census of Agriculture* were incorporated:

- the data became the ERS 1987 expense figures;
- the 1988-89 ERS estimates were based on the 1987 census-to-1987 FCRS ratio;
- the census to FCRS ratios were interpolated between 1982 and 1987; and
- the interpolated ratios were used to compute ERS estimates for 1983-86.

ERS analysts expanded the 1982-89 FCRS data to represent expenses for all farms. This adjustment in FCRS data takes into account the difference in number of farms in the FCRS and the NASS June Enumerative Survey. Most of the underrepresentation in the FCRS is in the small-size farms.

Off-Farm Income

The off-farm income figures for 1985-88 were revised upward because of the adjustment to the annual FCRS figures for the undercount of farms and the change in wording of the off-farm income question between the 1984 and 1985 FCRS. The sharp jump in the off-farm income figures between 1984 and 1985 resulted from the improvements in measuring off-farm income of principal farm operators.

Balance Sheet Changes

A number of changes have been incorporated into this year's balance sheet estimates. Benchmarks were updated using *1987 Census of Agriculture* data. Also, data from the FCRS and the *1988 Agricultural Economics and Land Ownership Survey* (AELOS), a follow-on survey to the *1987 Census of Agriculture*, have been incorporated into the procedures for allocating assets and debt by State. Furthermore, revisions were made to total real estate values back to 1982 and motor vehicles and other machinery inventory values back to 1978.

Inventory values of purchased inputs, based on the FCRS, have been added as an asset category. Since the FCRS is a survey of operators, the data are adjusted to incorporate the landlord share as found in the 1988 AELOS. This data series starts in 1984, the first year of available data from FCRS.

Financial assets are now presented in only two categories, net worth of farm cooperatives and other financial assets, because the benchmarks used to subdivide the other financial assets are outdated. In accordance with the reorganization of the Farm Credit System, real estate debt of the Federal land banks is now included in Farm Credit System debt. Likewise, nonreal estate debt for the production credit associations and Federal intermediate credit banks are now combined as Farm Credit System debt.

Building values (including values of dwellings and farm service structures) are now based on annual FCRS data for 1984-89, rather than estimated traditionally as a proportion of total farm real estate value. Adjustments are made to the FCRS data to fully account for the difference between the FCRS and USDA number of farms and to incorporate the landlord share as estimated in the 1988 AELOS. The 1989 FCRS was designed so that the value of dwellings owned by farm operations can be estimated separately for operator, hired labor, and other dwellings. The relationship between operator dwelling values and other dwelling values was revised for 1984 forward.

Compared with the previously used relationships based on *1979 Farm Finance Survey* data, the FCRS-based building values are a substantially larger proportion of total real estate values. Thus, there is a discontinuity in the building value series beginning in 1984. The relationship between land and farm buildings values is a high-priority research item within ERS for the next year. So, the values of dwellings, service structures, and land should be considered tentative, and subject to change, until further analyses of related data sources are completed.

The effect of larger dwelling values for 1984-88 is also evident on the debt side of the balance sheet, where the difference between including and excluding household accounts has increased. The amount of real estate debt attributable to dwellings is a function of dwelling values. Consequently, larger dwelling values have led to larger estimates of the debt associated with the dwellings. This procedural change has caused a discontinuity between 1983 and 1984 in our real estate debt series.

Table 1--Summary of the farm sector's financial status, by State, 1989

See footnotes on next page.

Footnotes for Table 4

1/ Contains revised data for many components for 1983 forward. The majority of the revisions are due to the incorporation of the newly released *1987 Census of Agriculture* data.

2/ Includes operator dwellings. New computational procedures and data sources are used in deriving the gross imputed rental income and expenses related to farm dwellings.

3/ Includes forest product sales, custom feeding services, and other farm business-related income.

4/ New methodology and data sources are used to compute the gross rental value of farm dwellings for 1984 forward.

5/ Includes machine hire and customwork expenses; marketing, storage, and transportation expenses; and miscellaneous expenses. Definition and data sources for 1978 and later are not directly compatible with those of earlier years.

6/ Includes contract labor expenses, hired labor wages, and Social Security payments.

7/ Uses different data sources for the periods before 1979, 1979-83, and 1984 and later, potentially creating inconsistencies in estimates among these periods.

8/ Excludes operator dwellings.

9/ Cash income less cash expenses and capital consumption.

10/ Gross farm income less rental value of operator dwellings.

11/ Gross receipts of farm businesses less nonfactor payments, interest, contract and hired labor expenses, and net rent to nonoperator landlords.

12/ Includes off-farm cash income for the principal farm operator and members of that farm operator's family.

Table 5--Cash receipts, by commodity groups and selected commodities, United States and States, 1985-89 1/

State and commodity	1985	1986	1987	1988	1989
			1,000 dollars

NA = not available. 1/ USDA estimates and publishes individual cash receipt values only for major commodities and major producing States. The U.S. receipts for individual commodities, computed as the sum of the reported States, may understate the value of sales for some commodities, with the balance included in the appropriate category labeled "other" or "miscellaneous." The degree of underestimation in some of the minor commodities can be substantial. 2/ All citrus sold before the traditional marketing year, which begins in October.

1/ Prior to 1988, Farm Credit System loans were reported separately for production credit association and Federal intermediate credit bank loans through other financial institutions.

*U.S.G.P.O:1991-281-091:40022/ERS

Keep current on economic analyses from the U.S. Department of Agriculture with *The Journal of Agricultural Economics Research.*

The Economic Research Service especially tailors this quarterly periodical to the internationa community of economists, statisticians, academicians, and agribusinesses who want in-depth reporting of contemporary agricultural economics research. Complementing the research articles are book reviews, a valuable source of information to keep you abreast of the latest literature.

JAER reflects the research of USDA employees and researchers under cooperative agreement with the Department. Readers in 54 countries have benefited from its incisive analyses.

Return the form along with your check for $8.00 (domestic), $10.00 (foreign--including Canada and Mexico) to ERS-NASS, P.O. Box 1608, Rockville, MD 20850. Make check payable to ERS-NASS. Or phone, toll free, 1-800-999-6779 and charge your purchase to your Visa or MasterCard.
